FDM

Clinical and Theoretical Application of the
Fascial Distortion Model
Within the Practice of Medicine and Surgery

Stephen Typaldos, D.O.

Research Background

- There is little evidence for manual therapy.
- Investigated objective treatment effects with a large amount of data.
- FDM is a reproducible treatment.
- AACD has a simple technique.
- Changes in dorsiflexion restriction due to AACD are easy to measure.

caused the injury, but of equal intensity. For instance, in a continuum sprained ankle, the calcaneofibular ligament typically exhibits an everted continuum distortion because bony components were pulled into it when the ankle buckled laterally. If the CD occurs at the origin of the ligament, the direction of force from the treating thumb should be directed into the attachment of the ligament on the calcaneus (see below). However, if the CD occurs at the insertion of the ligament, the direction of force from the treating thumb should be directed into the attachment of the ligament on the fibula. In either case, the amount of treatment force should be significant because the force of injury was significant.

Figure 5-2. Treatment of Lateral Ankle Continuum Distortion

Once the continuum distortion has resolved, it no longer exists, and the injured area is immediately improved (i.e., there is dramatically less pain and the neighboring joint demonstrates increased strength with greater mobility). Note that the two most significant factors of a successful continuum treatment are:

1. Proper direction
2. Adequate force

Research Outline

- Objective: To investigate the effect of AACD on improving dorsiflexion angle
- Period: From November 2019 to the end of December 2020
- Number of cases: 507
- Number of patients: 317
- Participating medical institutions: 12
- For aggregate analysis of data, a database developed by Claris FileMaker 15 is used.

caused the injury, but of equal intensity. For instance, in a continuum sprained ankle, the calcaneofibular ligament typically exhibits an everted continuum distortion because bony components were pulled into it when the ankle buckled laterally. If the CD occurs at the origin of the ligament, the direction of force from the treating thumb should be directed into the attachment of the ligament on the calcaneus (see below). However, if the CD occurs at the insertion of the ligament, the direction of force from the treating thumb should be directed into the attachment of the ligament on the fibula. In either case, the amount of treatment force should be significant because the force of injury was significant.

Figure 5-2. Treatment of Lateral Ankle Continuum Distortion

Once the continuum distortion has resolved, it no longer exists, and the injured area is immediately improved (i.e., there is dramatically less pain and the neighboring joint demonstrates increased strength with greater mobility). Note that the two most significant factors of a successful continuum treatment are:

1. Proper direction
2. Adequate force

Record Sheet

- Draw a line on the long axis of the fibula.
- Draw a line on the long axis of the fifth metatarsal.
- Flex the knees.
- The intersection angle of the long axis lines between the fibula and the fifth metatarsal bone is 90 degrees, measured as extension (dorsiflexion) and flexion (plantar flexion).

足 ankle	屈曲 (底屈) flexion (plantar flexion)	45	腓骨への垂 直線	第5中足骨	膝関節を屈曲位で行う。	
	伸展 (背屈) extension (dorsiflexion)	20

After (5 4 3 2 1)

ADA(※) Before () °

After Starching () °

After AACD () °

Total () °

※ADA = ankle dorsiflexion angle

How to measure angle

1. Draw a line on the long axis of the fibula
2. Draw a line on the long axis of the fifth metatarsal bone
3. Flex the knee
4. Measure dorsiflexion and plantar flexion with 90 degrees of the fibula and fifth metatarsal as 0 degrees.

Indications of evaluation

Swelling

Large: The ankle looks thicker

Medium: The shape of the condyle is swollen and deformed

Small: Not swollen or slightly swollen

Walking

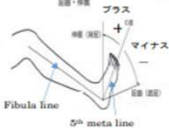

5: Normal no pain

4: Slight lameness, little pain

3: Lameness with pain

2: Be able to stand, but unable to move forward (need crutch)

1: Hardly put any weight ()

Evaluation of Swelling

Large:
Ankles appear thicker

Middle:
The ankles are swollen
and deformed.

Small:
Slight swelling or no
swelling.

Gait Evaluation

Point	Gait	Crutch
1	Unable to place the foot on the floor.	○
2	Able to stand but unable to move forward or walk.	○
3	Walking with a limp and experiencing pain.	—
4	Slight limp and mild discomfort.	—
5	Able to walk normally.	—

Effects(°)

Comparison of the Effects of AACD and Stretching

How to stretch

	Effect of Stretching (°)	Effect of AACD (°)	Number of cases
AACD		9.0	260
Stretching + AACD	4.6	9.9	247

AACD is twice as effective as stretching.

Influence of Practitioner Proficiency

	Years	Effect of AACD (°)	Number of cases
A	17 years	10.5	141
B	9 years	10.7	67
C	4 years	9.2	87
D	4 years	7.9	25
E	2 years	6.8	86

The effectiveness of AACD is influenced by experience and skill.

Number of Ankle Sprain Treatments

Times	Number of patients	Rate
1	206	65.4%
2	67	21.3%
3	21	6.7%
4	11	3.5%
5	4	1.3%
6	2	0.6%
7	4	1.3%

The effects of FDM are not temporary.
Average 1.6 treatments were required.

Summary

- AACD is 98.7% effective.
- AACD can improve dorsiflexion limitation by an average of 10°.
- AACD is about twice as effective as stretching.
- The average number of treatments is 1.6 times. Moreover, the effect is not temporary.
